

## **Task 5 Report**

**1. List the database software/products you ever used in your PC and/or Internet.**

What did you use them for?

DBeaver and MySQL

I have used DBeaver and MySQL for different purposes. During my internship, I mainly used DBeaver to work efficiently with my team. By using the same database environment, we were able to work together on front-end and back-end tasks more smoothly. MySQL, on the other hand, was used for my personal front-end and back-end projects. I used MySQL to create, store, and manage data, connecting through the terminal while using DBeaver to check the details when needed.

**2. What is the relation between database and Internet?**

Databases and the Internet are closely related. A Database Management System (DBMS) is used to store, manage, and provide access to large amounts of data, which is important for how the Internet works. Most of the information available on the Internet is stored in databases, allowing users to get data effectively. Databases provide the foundation for large-scale, fast, and secure data access, which is essential for the smooth running of internet services and for delivering information to users.
